

REDEFINE "TOOL," REDEFINE "MAN," OR ACCEPT CHIMPANZEES AS HUMANS

USING ANIMAL MODELS TO UNDERSTAND HUMAN BEHAVIOR

IN CONTEXT

KEY FIGURE

Jane Goodall (1934–)

BEFORE

1758 Carl Linnaeus, the father of taxonomy, dares to classify humans within the rest of nature, calling us *Homo sapiens* ("wise man").

1859 Charles Darwin's theory of evolution further challenges the established view that humans are different from the animal kingdom.

AFTER

1963 Konrad Lorenz publishes *On Aggression*, proposing that warlike behavior in humans is innate.

1967 Desmond Morris, a British zoologist and ethologist, publishes *The Naked Ape: A Zoologist's Study of the Human Animal*, a major study that describes human behavior in the context of the animal kingdom.

Modern molecular studies mapping the genomes of humans and other animals have confirmed a theory that was first suggested by Charles Darwin in the mid-19th century—that we share a common ancestor with the great apes. Today, few scientists would dispute that the common chimpanzee (*Pan troglodytes*) and the bonobo or pygmy chimpanzee (*Pan paniscus*) are
