CONTENTS

How to use this eBook

INTRODUCTION

THE STORY OF EVOLUTION

Time is insignificant and never a difficulty for nature • Early theories of evolution

A world previous to ours, destroyed by catastrophe • Extinction and change

No vestige of a beginning, no prospect of an end • Uniformitarianism

The struggle for existence • Evolution by natural selection

Human beings are ultimately nothing but carriers for genes • The rules of heredity

We've discovered the secret of life • The role of DNA

Genes are selfish molecules • The selfish gene

ECOLOGICAL PROCESSES

Lessons from mathematical theory on the struggle for life • Predator–prey equations

Existence is determined by a slender thread of circumstances • Ecological niches

Complete competitors cannot coexist • Competitive exclusion principle

Poor field experiments can be worse than useless • Field experiments

More nectar means more ants and more ants mean more nectar • Mutualisms

Whelks are like little wolves in slow motion • Keystone species

The fitness of a foraging animal depends on its efficiency • Optimal foraging theory

Parasites and pathogens control populations like predators • Ecological epidemiology

Why don't penguins' feet freeze? • Ecophysiology

All life is chemical • Ecological stoichiometry

Fear itself is powerful • Non-consumptive effects of predators on their prey
