climate change were additional factors. The time had come for an integrated approach.

One Health addresses many issues beyond zoonotic diseases, however. The disruption of ecosystems causes noncommunicable diseases, the loss of livelihoods, food insecurity, forced migration, and pollution. A significant percentage of the world's population breathes air that falls below the WHO's acceptable standards.

## Environmental ill-health

Building on the ideas of Schwabe and others, the UN Environment Programme has adopted the One Health approach to get agronomists, environmentalists, doctors, soil scientists, and governments to work closely together. According to the UN, pollution of the air, water, and soil accounts for 53 percent of deaths from chronic obstructive pulmonary disease (COPD); 40 percent of lung cancer fatalities; and 22 percent of cardiovascular disease deaths.

The WHO, the Food and Agriculture Organization of the UN, and the World Organization for Animal Health all back this approach, which encourages policies that restore ecosystems, rebuild biodiversity, and reduce the spread of disease. Sustainable agriculture, reforestation and other forms of rewilding, measures to reduce atmospheric and water pollution, and the responsible use of antibiotics are all important elements of the approach.
