increased sharply from the mid-19th century. In 1958, the level was 316 ppmv. It rose steadily at a rate of 1.3–1.4 ppmv each year until the mid-1970s, then increased by about 2 ppmv each year. By spring 2018 it had hit 411 ppmv, almost 1.5 times higher than preindustrial levels.

The Keeling Curve of steadily rising CO_2 levels is clearly shown on a graph plotting results from the continuous monitoring of atmospheric carbon dioxide (CO_2) at Mauna Loa, Hawaii.
