Life is supported by a vast network of processes • Energy flow through ecosystems

The world is green • Trophic cascades

Islands are ecological systems • Island biogeography

It is the constancy of numbers that matters • Ecological resilience

Populations are subjected to unpredictable forces • The neutral theory of biodiversity

Only a community of researchers has a chance of revealing the complex whole • Big ecology

The best strategy depends on what others are doing • Evolutionarily stable state

Species maintain the functioning and stability of ecosystems • Biodiversity and ecosystem function

ORGANISMS IN A CHANGING ENVIRONMENT

The philosophical study of nature connects the present with the past • The distribution of species over space and time

The virtual increase of the population is limited by the fertility of the country • The Verhulst equation

The first requisite is a thorough knowledge of the natural order • Organisms and their environment

Plants live on a different timescale • The foundations of plant ecology

The causes of differences among plants • Climate and vegetation

I have great faith in a seed • Ecological succession

The community arises, grows, matures, and dies • Climax community

An association is not an organism but a coincidence • Open community theory

A group of species that exploit their environment in a similar way • The ecological guild

The citizen network depends on volunteers • Citizen science

Population dynamics become chaotic when the rate of reproduction soars • Chaotic population change

To visualize the big picture, take a distant view • Macroecology
