lands of Indigenous peoples. Pharmaceutical, agricultural, and cosmetics corporations, in particular, use DSI for many projects, including the development of medicines, studies of infectious diseases, and research into ways to make plants more resilient against climate change.

Until now, poorer countries and Indigenous peoples have not benefited directly from this activity. The 2024 UN Biodiversity Conference, however, agreed that the benefits should be shared and that corporations should pay a voluntary 1 percent of their profits or 0.1 percent of their sales into the "Cali Fund," which will be divided up fairly between the nations providing the data. Also, at least half of this fund is expected to support the self-identified needs of Indigenous peoples and local communities.
