Nature's true value

Between 1992 and 2014, while the amount of material capital generated globally per person doubled, the stock of natural capital—the total of all Earth's ecosystems—declined by nearly 40 percent. That decline is simply not sustainable.

The British government asked Indian- British economist Partha Dasgupta to report on the economics of natural capital. His 2021 report declares that nature is "our most valuable asset." It argues that truly sustainable economic growth means recognizing that our long-term prosperity requires
