

1917. Joseph Grinnell publishes his research on the California thrasher bird, establishing the basis for the theory of ecological niches.

1925 to 1926. The Lotka-Volterra model uses a mathematical equation to describe the interactions between predator and prey.

1957. Robert MacArthur’s research on North American warblers shows how different species can avoid directly competing with each other in order to coexist.

1961. Joseph Connell reveals that different types of barnacle thrive in different tidal zones, although they could, in theory, live in any of them.

1965. Dan Janzen observes the interdependence of acacia trees and the ants
