8. Which lecture is scheduled between Statistics and English?
(a) Economics
(b) History
(c) Mathematics
(d) No Lecture
Ans. (b)

9. Which lecture is the last one in the week ?
(a) History (b) English
(c) Math (d) Economic
Ans. (c)

10. Which lecture is scheduled on Wednesday ?
(a) Statistics (b) Economics
(c) English (d) History
Ans. (c)

11. Which lecture is scheduled before the Mathematics lecture
(a) Economics (b) History
(c) Statistics (d) English
Ans. (a)

Direction for the following 15 (fifteen) items :

Read the following three passages and answer the items that follow each passage. Your answer to these items should be based on the passage only.

Passage–1

Education, without a doubt, has an important functional Instrumental and utilitarian dimension. This is revealed when one asks question such as what is the purpose of education ? 'The answers, too often, are' to acquire qualifications for employment/ upward mobility', 'wider/higher (in terms of income) opportunities', and 'to meet the need s for trained human power in diverse fields for national development'. But in its deepest sense education is not instrumentalist. That is to say, it is not to be justified outside to itself because it leads to the acquisition of formal skills or the certain desired psychological social attributes. It must be respected in itself. Education is thus not a commodity to be acquired or possessed and then used, but a process of inestimable importance it individuals and society, although it can and does have enormous use value. Education then, is a process of expansion and conversion, not in the sense of converting or turning students into doctors or engineers, but the widening and turning out of the mind- the creation, sustenance and development of self-critical awareness and independence of thought. It is an inner process of moral –intellectual development.

12. What do you understand by the 'instrumentalist' view of education ?
(a) Education is functional and utilitarian in its purposes.
(b) Education is meant to fulfils human needs.
(c) The purpose of education is to train the human intellect.
(d) Education is meant to achieve moral development

Ans. (a) According to the passage, education without doubt has an important functional instrumental and utilitarian dimension. But in deepest sense education is not instrumentalist. That is to say, it is not to be justified outside to itself because it leads the acquisition of formal skill or the certain desired psychological social attributes.

13. According to the passage, education must be respected in itself because
(a) it helps to acquire qualifications for employment
(b) it helps in upward mobility and acquiring social status
(c) it is an inner process of moral and intellectual development.
(d) All the (a),(b) and (c) given above are correct in this context.

Ans. (c) If we observe in the passage, it is clearly mentioned that education is process of expansion and conversion, not in the sense of converting or turning students into doctors and engineer's and providing employment but also it helps us in widening and turning out of the mind, the creation, sustenance and development of self critical awareness and independence of thought. It is also inner process of moral - intellectual development.

14 Education is a process in which
(a) students are converted into trained professionals.
(b) opportunities for higher income are generated.
(c) individuals develop self-critical awareness and independence of thought.
(d) qualifications for upward mobility are acquired.

Ans. (c) According to the passage education is a process of expansion and conversion not in the sense of converting or turning out of the mind the creation, sustenance and development of self critical awareness of thought.

Passage-2

Chemical pesticides lose their role in sustainable agriculture if the pests evolve resistance. The evolution of pesticide resistance is simply natural selection in action. It is almost certain to occur when vast numbers of a genetically variable population are killed. One or a few individuals may be unusually resistant (perhaps because they possess an enzyme that can detoxify the pesticide). If the pesticide is applied repeatedly, each successive generation of the pest will contain a larger proportion of resistant individuals. Pests typically have a high intrinsic rate of reproduction and so a few individuals in one generation may give rise to hundreds or thousands in the next, and resistance spreads very rapidly in a population.

This problem was often ignored in the past even though the first case of DDT (dichlorodiphynyltrich Ioroethane) resistance was reported early as 1946. There is exponential increase in the numbers of invertebrates that have evolved resistance and in the number of pesticides against which resistance have evolved. Resistance has been recorded in every family of arthropod pests (including dipterans such as mosquitoes and house files, as well as beetles, moths, wasps, fleas, lice and mites) as well as well as in weeds and plant pathogens. Take the Alabama leafworm, a moth pest of cotton, as an example . It has developed resistance in one or more regions of the world to aldrin, DDT dieldrin, endrin lindane and toxaphene.

If chemical pesticides brought nothing but problems- if their use was intrinsically and acutely unsustainable- then they would already have fallen out of widespread use. This has not happened. Instead, their rate of production has increased rapidly. The ratio of cost of benefit for the individual agricultural producer has remained in favour of pesticide use. In the USA, insecticides have been estimated to benefit the agricultural products to the tune of around $5 for every $1 spent.

Moreover, in many poorer countries, the prospect of imminent mass starvation, or of an epidemic diseases are so frightening that the social and health costs of using pesticides have to be ignored. In general the use of pesticides is justified by objective measures such as 'lives saved', 'economic efficiency of food production' and 'total food produced'. In these very fundamental senses, their use may be subscribed as sustainable. In practices, sustainability depends on continually developing new pesticides that keep at least one step ahead of the pests-pesticides that are less persistent, biodegradable and more accurately targeted at the pests.

15. ''The evolution of pesticide resistance is natural selection in action.'' What does it actually imply?
(a) It is very natural for many organisms to have pesticide resistance.
(b) Pesticide resistance among organisms is a universal phenomenon.
(c) Some individuals in any given population show resistance after the application of pesticides.
(d) None of the statements (a), (b) and (c) given above is correct.

Ans. (c) According to the passage, it is very clear that chemical pesticide lose their role in sustainable agriculture if the pests evolve resistance. The evaluation of pesticide resistance is simply naturally selection in action. It is almost certain to occur when vast numbers of a genetically, variable population are killed. One or a few individuals may be unusually resistance.

16. With reference to the passage consider the following statements :
1. Use of chemical pesticides has become imperative in all the poor countries of the world.
2. Chemical pesticides should not have any role in sustainable agriculture.
3. One pest can develop resistance to many pesticides.

Which of the statements given above is/are correct?
(a) 1 and 2 only
(b) 3 only
(c) 1 and 3 only
(d) 1, 2 and 3

Ans. (b) With reference to the passage, if pesticides are used repeatedly, each successive generation of the pest will contain a large proportion of resistance individuals. It is as so because few individual posses enzymes that can detoxify the pesticide.

17. Though the problems associated with the use of chemical pesticides is known for a long time. Their widespread use has not waned. Why ?
(a) Alternatives to chemical pesticides do not exist at all.
(b) New pesticides are not invented at all.
(c) Pesticides are biodegradable.
(d) None of the statements (a), (b) and (c) given above is correct.

Ans. (d) With reference to the passage, moreover, in many poorer countries, the prospect of imminent mass saturation or of an epidemic disease are so frightening that the social and health cost of using pesticides have to be ignored. In general the use of pesticide is justified by objective measure such as life saved. This sense suggest that alternative to chemical pesticides are existing and new variety of pesticides are experiment and they are targeting biodegradable pest which are not available now. So, option a, b, c are wrong and thus, option (d) is correct.

18. How do pesticides act as agents for the selection of resistant individuals in any pest population ?
1. It is possible that in a pest population the individuals will behave differently due to their genetic makeup.
2. Pests do possess the ability to detoxify the pesticides.
3. Evolution of pesticide resistance is equally distributed in pest population.

Which of the statements given above is/are correct ?
(a) 1 only
(b) 1 and 2 only
(c) 3 only
(d) 1, 2 and 3
