Ans. (b) From the passage it is very clear that some of the pest population have special enzyme that can detoxify the pesticide and increases the resistant power. This individual pest behave differently due to their different genetic makeup. Thus, option (1) and (2) is correct, so option (b) is correct.

19. Why is the use of chemical pesticides generally justified by giving the examples of poor and developing countries ?

1. Developed countries can afford to do away with use of pesticides by adapting to organize farming, but it is imperative for poor and developing countries to use chemical pesticides.
2. In poor and developing countries, the pesticides addresses the problem of epidemic diseases of crops and eases the food problem.
3. The social and health costs of pesticide use are generally ignored in poor and developing countries.

Which of the statements given above is/are correct?

(a) 1 only
(b) 1 and 2 only
(c) 2 only
(d) 1, 2 and 3

Ans. (c) These use of chemical pesticide generally justified by giving the example of poor and developing countries, if we use pesticides in poor and developing countries it addresses the problem of epidemic disease of crops and eases the food problem.

20. What does the passage imply?

(a) Alternative options to chemical pesticides should be promoted.
(b) Too much use of chemicals is not good for the ecosystem.
(c) There is no scope for the improvement of pesticides and making their use sustainable.
(d) Both the statements (a) and (b) above are correct.

Ans. (d) Given passage implies that too much uses of chemical is not good for the ecosystem and it may lead to ecological imbalance and thus there should be alternative options to chemical pesticides should be promoted thus statement (a) and (b) both are correct. Whereas statement (c) says, there is no scope for the improvement of pesticides and making their use sustainable, which is not correct. So, option (d) is correct.

Passage-3

Today's developing economies use much less energy per capita than developed countries such as the United States did at similar incomes, showing the potential for lower-carbon growth. Adaptation and mitigation need to be integrated into a climate-smart development strategy that increases resilience, reduces the threat of further global warming, and improves development outcomes. Adaptation and mitigation measures can advance development, and prosperity can raise incomes and foster better institutions. A healthier population living in better-built houses and with access to bank loans and social security is better equipped to deal with a changing climate and its consequences. Advancing robust, resilient development policies that promote adaptation is needed today because changes in the climate, already begun, will increase even in the short term.

The spread of economic prosperity has always been intertwined with adaptation to changing ecological conditions. But as growth has altered the environment and as environmental change has accelerated, sustaining growth and adaptability demands greater capacity to understand out environment generate new adaptive technologies and practices and diffuse them widely. As economic historian have explained, much of humankind's creative potential has been directed at adapting to the changing world. But adaptation cannot cope with all the impacts related to climate change's especially as larger changes unfold in the long terms.

Countries cannot grow out of harm's way fast enough to match the changing climates. And some growth strategies. Whether driven by the government or the market, can also add to vulnerability-

Particularly if the overexploit natural resources. Under the Soviet development plan, irrigated cotton cultivation expanded in water-stressed Central Asia and led to the near disappearance of the Aral Sea, threatening the livelihoods of fishermen, herders and farmers. And clearing mangroves-the natural coastal buffers against storm surges- to make way for intensive farming or housing development, increases the physical vulnerability of coastal settlements, whether in Guinea or in Louisiana.

21. Which of the following conditions of growth can add to vulnerability ?

1. When the growth occurs due to excessive exploitation of mineral resources and forests.
2. When the growth brings about a change in humankind's creative potential
3. When the growth is envisaged only for providing houses and social security's to the people.
4. When the growth occurs due to emphasis on farming only.

Select the correct answer using the code given below.

(a) 1 only
(b) 2, 3 and 4 only
(c) 1 and 4 only
(d) 1, 2, 3 and 4 only

Ans. (a) According to the passage, countries cannot grow out of harms way fast enough to match the changing climates. And some growth strategies, whether driven by the government or the market can also add to vulnerability, particularly if they overexploit natural resource like minerals and forest, thus option (a) only 1 is correct and other statements does not supports the conditions.

22. What does low-carbon growth imply in the present context?

1. More emphasis on the use of renewable sources of energy.
2. Less emphasis on manufacturing sector and more emphasis on agriculture sector.
3. Switching over from monsoculture practices to mixed farming.
4. Less demand for goods and service

Select the correct answer using the codes given below.

(a) 1 only
(b) 2, 3 and 4
(c) 1 and 4 only
(d) None of the above implies low carbon growth

Ans. (a) The first paragraph of the passage talks about how developing countries are using less energy per capital than developed countries and similarly they develop same income and this shows potential for lower carbon growth and gave more emphasis on the use of renewable energy resource.

23. Which of the following conditions is/are necessary for sustainable economic growth ?

1. Spreading of economic prosperity more.
2. Popularising/spreading of adaptive technologies widely
3. Investing on research in adaptation and mitigation technologies.

Select the correct answer using the codes given below

(a) 1 only
(b) 2 and 3 only
(c) 1 and 3 only
(d) 1, 2 and 3

Ans. (b) According to the passage, adaptation and mitigation measures can advance development and prosperity can raise income and foster better institution but whereas adaptation and mitigation need to be integrated into a climate smart development strategy for sustainable growth so the necessary conditions for sustainable economic growth are popularising/spreading of adaptive technology widely and also investing on research in adaptation and mitigation technologies. Thus, statement (2) and (3) are correct.

24. Which of the following inferences can be made from the passage?

1. Rainfed crops should not be cultivated in irrigated areas.
2. Farming under water-deficient areas should not be a part of development strategy.

Select the correct answer using the codes given below :

(a) 1 only
(b) 2 only
(c) Both 1 and 2
(d) Neither 1 nor 2

Ans. (d) If we go through passage these is nowhere mentioned about Rainfed crops irrigation and farming under water deficient areas. So, we can't conclude about any of the given statement. Thus, option (d) is correct.

25. Consider the following assumptions :

1. Sustainable economic growth demands the use of creative potential of man.
2. Intensive agriculture can lead to ecological backlash.
3. Spread of economic prosperities can adversely affect the ecology and environment.

With reference to the passage, which of the above assumptions is/ are valid?

(a) 1 only
(b) 2 and 3 only
(c) 1 and 3 only
(d) 1, 2 and 3

Ans. (d) According to passage the spread of economic prosperity has always been intertwined with adaptation to changing ecological conditions. But as growth has altered the environment and as environmental change has accelerated sustaining growth and adaptability demands greater capacity to understand out environmental generate new adaptive technologies and practices and diffuse them widely. Thus, statement (1) and (3) are correct and also clearing mangroves the natural coastal buffers against storm surges to make way for intensive farming increases the vulnerability and dead to ecological back clash. Thus, statement (2) is also correct.
