

The vines are alive!

Green tree snakes have light, skinny bodies for creeping and climbing. Their skin color helps them to hide among green vines and foliage as they hunt for birds or tree-dwelling frogs and lizards.

Reptile file

- A person can walk faster than most snakes' top speed.
- The mangrove ratsnake of Southeast Asia can catch bats as they fly out to feed.
- Egg-eating snakes crack open their food using tooth-like spines in their throats. Later, they spit out the shell.

Without venom, the milksnake has to strangle (constrict) its prey.

The great pretender

The milksnake (right) is harmless, but has the same set of colors as the venomous coral snake (above). Predators get confused and so prefer not to attack.

and twitch the tip to rattle out a warning "buzz."

Rubbernecks

Many snakes eat hard-shelled birds' eggs or soft-shelled reptile eggs. The African egg-eating snake only eats birds' eggs. It can unhook its jaws to swallow eggs that are at least twice the size of its head.
