added. The lack of job creation makes it "feel" as if the economy is in a recession, even though the economy is still advancing. Many economists believe that between 2002 and 2003, the United States' economy was in a growth recession. In fact, at several points over the past 25 years the U.S. economy is said to have experienced a growth recession. That is, in spite of gains in real GDP, job growth was either non-existent or was being destroyed at a faster rate than new jobs were being added.

Experts have revived this term in the wake of ongoing financial cises in the Euro-American economies since 2010. The situation is better described by the term ***'double-dip recession'.***

CONCLUSION

Business cycles are basically fluctuations in the production levels of economies above and below the trend of the equilibirium levels.[84] But why do economies fluctuate? There are many factors which are said to be responsible for it, as per the experts:

(i) Economic instability and uncertainty (due to logical or illogical expectations) may discourage investments thereby reducing growth in the long-term.

(ii) A lack of the creative destruction (i.e. innovation) may put the economy in a slump or slowdown in its overall production.

(iii) Anti-inflationary government policies (specially when general elections are nearing) may direct the attraction of investors in the economy.

(iv) Unforseen disasters may cause economies to fluctuate.
