3. The Irrigation

For controlled growth of crops and adequate dilution of fertilizers, a controlled means of water supply was required. It made two important compulsions—firstly the area of such crops should be at least free of flooding and secondly, artificial water supply should be developed.[21]

4. Chemical Pesticides and Germicides

As the new seeds were new and non-acclimatised to local pests, germs and diseases than the established indigenous varieties, use of pesticides and germicides became compulsory for result-oriented and secured yields.

5. Chemical Herbicides and Weedicides

To prevent costlier inputs of fertilisers not being consumed by the herbs and the weeds in the farmlands, herbicides and weedicides were used while sowing the HYV seeds.

6. Credit, Storage, Marketing/Distribution

For farmers to be capable of using the new and the costlier inputs of the GR, availability of easy and cheaper credit was a must. As the farmlands suitable for this new kind of farming was region-specific (as it was only Haryana, Punjab and Western Uttar Pradesh in India) storage of the harvested crops was to be done in the region itself till they were distributed throughout the country. Again, the countries which went for the GR were food-deficient and needed the new yield to be distributed throughout the country and a proper chain of marketing, distribution and transport connectivity was necessary. All these peripheral infrastructure were developed by the countries going for the GR with softer loans coming from the World Bank—India being the biggest beneficiary.[22]

Impact of the Green Revolution

The GR had its positive as well as negative socioeconomic and ecological impacts on the countries around the world, we will specially study India
