(c) *Environmental degradation* due to excessive and uncontrolled use of chemical fertilisers, pesticides and herbicides have degraded the environment by increasing pollution levels in land, water and air. In India it is more due to *deforestation* and extension of cultivation in ecologically fragile areas. At the same time, there is an excessive pressure of animals on forests—mainly by goats and sheeps).

II. Toxic Level in Food Chain Toxic level in the food chain of India has increased to such a high level that nothing produced in India is fit for human consumption. Basically, unbridled use of chemical pesticides and weedicides and their industrial production combined together had polluted the land, water and air to such an alarmingly high level that the whole food chain had been a prey of high toxicity.

Conclusion

The above studies and the report were eye-openers in the area of ecologically non-sustainable kind of agriculture as well as a big question mark on it. This was the time when agro-scientists suggested for a really 'green' (eco-friendly) green revolution which is today known among the experts with many more names-the *evergreen revolution,* the *second*—green revolution the *green farming.*

MINIMUM SUPPORT PRICES (MSP)

The Government of India started announcing the Minimum Support Prices (MSP) in 1966–67 for wheat which was expanded to cover many more crops in the coming years in the wake of the Green Revolution which might have resulted into fall in prices of wheat depleting farmers' profit. It is a minimum price at which the government will purchase farmers' crops—whatever may be the market price for the crops.[25]
