economies as to which comparative extent they have been able to fulfill the needs of their population.

There are two aspects of this challenge. First, the availability of the goods and services required by the population and second, the presence of the supply network. Every economy has to guarantee required level of goods and services out of its production process at first. For this, proper level of production capacity is built up which requires a particular level of capital formation or investment. From where the investible funds will be managed is altogether a separate question. Whether the investment will come from the government, the domestic private sector or the foreigners? Once these details are cleared and selected as per the socio-economic conditions of the economy, a proper distribution network for the goods and services produced is assured.

Distribution Network Models

In the arena of ***distribution network,*** we have three historically existing models—**state**, **market** and **state–market mix.** In the first kind of distribution system, the state (i.e. the government) takes the sole responsibility of supplying the goods and services required by the population with no payments being done by the consumer—The former Soviet Union and Communist China being the best examples. In the second categorys comes the market mode of distribution which functions on the basis of price mechanism. In this system, goods and services are made available in the market and on the basis of their demand and supply, their prices are determined in the open market and finally they get distributed to the population. This was the distribution system of the capitalist economies —the whole Euro-America till 1930s. The third and the most prevalent mode of distribution developed out of the experiences of the former two systems is the state–market mix. This distribution system has certain goods and services which might be made available to the population freely or at the subsidised prices by the state and some might be supplied by the market for which consumers need to pay. Almost all economies of the world today follow one or the other kinds of distribution system. As the socio-economic composition of the population of an economy changes the mixture of the
