pollutant of aquatic resources. It has also been estimated that 75 per cent of the water pollution is on account of disposal of untreated/partially treated *sewage* by local bodies.

- The problem of water quality has further been aggravated because of *diminishing water flow in rivers.* The Central Pollution Control Board (CPCB) is monitoring water quality of rivers at 980 locations covering 353 rivers in terms of Dissolved Oxygen (DO), Bio-chemical Oxygen Demand (BoD), and fecal coliforms. One hundred and fifty stretches on 105 rivers have been identified as polluted.
- It is estimated that around 57 million tonnes per annum of municipal solid waste (MSW) is presently generated in the country. Based on its physico-chemical characteristics, the MSW generated in Indian cities is suitable for composting. However, presently the country has a rated capacity of processing around 6,000 tonnes per day of mixed waste into compost. Lack of proper enforcement for disposal of hazardous waste results in abandoned hazardous waste dumps, some of which bioaccumulate through the *food chain*, thereby posing long-term health risks.
- Approximately 15,722 tonnes of plastic waste is generated in the country per day, only *60 per cent of which is recycled* due to low collection efficiency. Fly ash, phospogypsum, and iron and steel slags are the major forms of industrial solid wastes- around 160 million tonnes per annum of fly ash is generated, of which only 91.2 million tonnes per annum is utilized by cement plants, road embankments, fly ash bricks, and back filling of mines, etc.

ECONOMIC SURVEY 2012-13 ON INDUSTRY

The inputs and advice of the government document on industry may be summarised as has been given below –

- After recovering to a growth of 9.2 per cent in 2009-10 and 2010-11, growth of value added in industrial sector, comprising
