Management ‘Global Trends in Renewable Energy investment 2012’).The global community is now working upon a set of Sustainable Development Goals (SDGs) possibly to be integrated with Millennium Development Goals (MDGs) for the post 2015 global policy architecture. Simultaneously the world in the past decade has entered into many new environmental agreements. Along with the governments also the private sector has been forthcoming. However, multilateral and bilateral funding dedicated to environmental purposes fluctuated and was faced with unmet promises to a great extent.

Sustainable Development and Climate Change in the Indian Context

In the past two decades, the key environmental challenges in India have been sharper. *The State of the Environment Report* by the MoEF clubs the issues under five key challenges faced by India –

1. Climate Change,
2. Food Security,
3. Water Security,
4. Energy Security, and
5. Managing Urbanisation.

Climate change is disturbing the natural ecosystems and is expected to have substantial adverse effects in India, mainly on agriculture (on which 58 per cent of the population still depends for livelihood), water storage in the Himalayan glaciers which are the source of major rivers and groundwater recharge, sea-level rise, and threats to a long coastline and habitations. Climate change will also cause increased frequency of extreme events such as floods, and droughts. These in turn will impact India’s food security problems and water security. As per the *Second National Communication* submitted by India to the UNFCCC, it is projected that the annual mean surface air temperature rise by the end of the century ranges from **3.5 ^{0} C to 4.3 ^{0} C,** whereas the sea level along the Indian coast has been rising at the rate of about **1.3 mm/year** on an average. These climate change projections
