- Housing, or
- Agriculture

And finally, to make the above-given sectors grow sustainably. This leads us to the next and most **vital issue** of finding and raising new and additional resources for meeting economic well-being needs with greater environmental sustainability. More often, it is the resource crunch which is the stumbling block for developing countries like India. While it makes efforts to efficiently and expeditiously bring price signals and other policy instruments into play, India could do much more if new and additional finance and technology are made available through multilateral processes.

"Be it national or global, environmental decline and global warming occurred gradually over decades and centuries, picking up pace with time. We must remember that the clock is now ticking on the needed global action to combat and contain this decay. This action should be fair, just and equitable for all countries so that our future has ecological and economic space for sustainable development for all".[8]

Moreover, mankind is faced with a situation when, by all means, it develops and selects the kind of 'technologies' which have the minimum or least 'fallouts' on our eoclogy and environment in the process of promoting the cause of mankind's development. Absence of global concensus cannot be cited by the individual nations as a refuge to sit idle and continue in the mode of 'business as usual'. Before it is too late, the conscience of humanity must awaken from its inertia.

EPILOGUE

Hardly anything makes economic sense unless its continuance for a long time can be projected without running into absurdities.[9] Growth and development can happen to a 'limited objective', but it cannot be stretched upto an 'unlimited extent'. How can the 'finite' earth support mankind's 'infinite' physical needs? – long before this was postulated by the 'Club of Rome' in 1972, exactly the same thing Gandhiji had said in late thirties itself, 'Earth provides enough to satisfy every man's need, but not for every
