IFA 2026's most interesting appliances

From AI washers to smart robot cleaners, it's quite a list

Vikhyat Rishi | editor@digit.in

IFA 2026 in Berlin brought together some of the biggest names in home appliances, with manufacturers showing how quickly everyday machines are becoming more automated, adaptable and capable. From robot cleaners that can use high-temperature steam to refrigerators that respond to natural-language commands, the latest products are tackling everything from stubborn floor stains to limited kitchen space.

Dreame, LG, Samsung, Bosch, Dyson and Xiaomi were among the companies making a strong showing at the event. Their latest products span robot vacuums, washing machines, refrigerators, air purifiers, air conditioners and even an unusually ambitious connected toothbrush.

Dreame's robot cleaning

Dreame continued to build on its strength in robotic floor care at IFA 2026 with the Aqua20 Pro Ultra Roller X Complete. The robot combines vacuuming and mopping with a high-temperature steam-cleaning system, making it one of the more unusual approaches to floor cleaning.

The machine uses 180°C steam to tackle dried-on grease and other stubborn dirt. Fresh water is supplied to the roller mop, while dirty water is collected separately. The roller can apply up to 18N of downward pressure.

LG's AI kitchen

LG's IFA 2026 showcase was spread across refrigerators, laundry, dishwashers and kitchen appliances, with heavy focus on energy efficiency and space-conscious designs.

One of the more unusual products was the new LG SIGNATURE refrigerator with LLM-based voice recognition. It uses a 6.8-inch display and allows users to interact with the appliance using natural-language commands rather than conventional controls.

LG's AI Fresh system can also analyse patterns and pre-cool the fridge before anticipated door openings. The idea is to make temperature management responsive without needing users to manually change settings.

The company showed its new Fit & Max washer and dryer, designed for European homes with limited space. LG says the washing machine can consume up to 70% less energy than the minimum requirement for an A-rated appliance in Europe.

Samsung's smart laundry

Samsung's IFA 2026 presentation put a major emphasis on laundry. The company unveiled two new Bespoke AI Washer models, including a 10 kg machine targeting an A-70% energy-efficiency level and a 13 kg model designed to fit within a standard 600 mm depth. The 10 kg washer builds on Samsung's push beyond the minimum European Class A efficiency requirement. The company says it can use up to 70% less energy than the threshold required for an A-rated appliance.

The 13 kg Bespoke AI Washer takes a different approach. Instead of making the appliance deeper to accommodate more laundry, Samsung uses SpaceMax technology to increase internal capacity while maintaining a standard 600 mm external depth. That could be particularly useful for households that need to wash bulky items but cannot accommodate a larger machine.

Dyson's floor care

Dyson had one of the most diverse technology showcases at IFA 2026, spanning floor care, air purification, robotics and personal care.

The Dyson CameraJet was arguably its most unconventional unveiling. It is a connected toothbrush with an integrated 100,000-pixel macro camera designed to identify gaps between teeth in real time. Dyson's Gap Optical Targeting system uses machine learning to analyse the live camera feed and trigger a targeted burst of mouthrinse where it detects an interdental gap. The system combines brushing, targeted liquid flossing and mouthwash dispensing in a single device.
