AGI vs ASI: What is the difference?

Every few months, somebody at a frontier AI lab thinks the rest of us ought to worry about a new acronym. It began with AGI. Then it became ASI. What's the difference?

What is AGI

AGI refers to AI capable of learning and performing intellectual tasks across fields exactly like humans. Unlike narrow AI, it could reason about unfamiliar problems in law, programming, biology, or small talk. But there is no agreed finish line, making claims that systems offer a "taste of AGI" debatable.

What is ASI

ASI refers to AI that surpasses human intelligence across all domains like science and problem-solving. Unlike AGI, which can be tested through benchmarks and real-world tasks, ASI is hypothetical. No working ASI system exists, so predictions about its capabilities are speculative. **tinyurl.com/dwt4reg**

ChatGPT co-creator launched an AI that can't hallucinate: Here's how it works

TypeSafe AI's Jev takes a different approach from traditional chatbots by producing structured, typed answers instead of natural-language responses. Built for behind-the-scenes decisions such as classification, scoring and routing, it avoids generating open-ended text, reducing chances for hallucinations. Its Reinforcement Learning for Calibrated Decisions (RLCD) training focuses on confidence and uncertainty. TypeSafe claims Jev can deliver significantly faster responses and lower costs than conventional LLMs, making it suited for repetitive software workflows. **tinyurl.com/uf387dw**

OpenAI launches ChatGPT Images 2.5 with faster generation, better editing and new Sketch feature

OpenAI has launched ChatGPT Images 2.5, its latest image-generation model with faster generation, improved detail, lighting, textures and reference-image preservation. It offers more precise targeted and multi-turn editing, with latency reduced by up to 50% compared to Images 2.0. New Sketch and Templates features enable doodle-based creation and custom formats. **tinyurl.com/s29ujfe**
