Samsung Galaxy Z Fold 8 Ultra

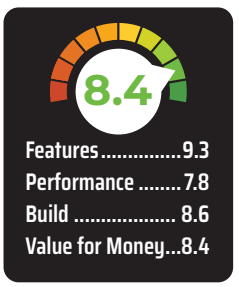

This is what Ultra on a Foldable looks like

₹1,99,999

When Samsung applied the 'Ultra' suffix to its Galaxy S series, it carried a clear promise that you are getting the biggest camera, the most capable chip and the finest materials. Ultra was a statement of excess and Samsung generally kept it. But applying that same label to the Galaxy Z Fold line is a more complicated proposition because foldables operate under tighter constraints than slab phones; every millimetre of thickness and every gram of weight is a trade-off that doesn't exist in the same way for a conventional flagship. Building an 'Ultra' inside something that folds in half is a different kind of engineering problem.

The Galaxy Z Fold 8 Ultra, at Rs 1,99,999 for the base 256 GB variant, is Samsung's attempt to resolve that problem. It is a direct successor to the Fold 7, keeping the same 215 g weight and a nearly identical form factor, but upgrading virtually everything inside. The Snapdragon 8 Elite Gen 5 replaces the Snapdragon 8 Elite. The battery grows from 4,400 mAh to 5,000 mAh silicon-carbon and the charger steps from 25 W to 45 W, which is the quality-of-life change Fold owners have been asking for across multiple iterations now. The inner display gains Flex Titanium technology to reduce the crease and an anti-reflective coating to reduce glare. Factory calibration, as our Calman testing confirms, is reference-grade on both panels. And for the first time on a foldable, Android 17 based OneUI 9 ships out of the box.

DESIGN

The Fold 8 Ultra looks immediately familiar to anyone who has held the Fold 7. It has practically the same proportions, the same Advanced Armor Aluminum frame, the same 8.9 mm folded thickness. At 4.1 mm when open, it is a hair thinner than the Fold 7's 4.2 mm and the slightly indented side frame and revised hinge gap make it easier to get a nail under the device to unfold one-handed. These are small changes that make the daily opening ritual feel just slightly more natural.

The two meaningful structural updates are Flex Titanium and the Gorilla Glass Victus Ceramic 3 protection. Flex Titanium is a titanium alloy plate placed under the inner display, stiffening the panel assembly and making the crease noticeably less visible than on the Fold 7. It doesn't disappear entirely and you will still feel it under your fingertip if you drag across the fold, but in normal viewing it has gone from something that registers in the first five minutes to something you largely stop thinking about. The Gorilla Glass Victus Ceramic 3 on the outer display is tougher than its predecessor, adding confidence to a panel that takes most of the daily wear.

The cover screen is 6.5 inches: narrower and taller than the inner canvas, more phone-like than some competing foldables with wider outer displays. For one-handed typing and quick glance use, it works. For consuming media on the outer screen, the narrower format will immediately send you to the inner panel but it also depends entirely on how you use a foldable.

DISPLAY

The Fold 8 Ultra's display story has two parts: the visual experience and the colour accuracy behind it. Our peak brightness test measured 2,810 nits on the main inner screen and 2,750 nits on the cover in HDR mode. For context, the Fold 7 measured 2,400 nits on the main panel and 2,480 nits on the cover in our equivalent tests. These are meaningful gains, particularly for outdoor use as both screens cut through direct sunlight with ease and the anti-reflective coating on the inner display reduces glare in ways that the Fold 7 simply couldn't.

Our Calman testing evaluated both panels in Samsung's Natural colour profile, which maps SDR content to the sRGB colour space. The main inner screen returned an average DeltaE of just 0.61 across the Colour Checker suite. To put that in context, the Fold 7's main screen averaged 1.6 in our equivalent test, which we already considered excellent. The Fold 8 Ultra's 0.61 is reference-monitor territory as any delta under 1.0 is considered near-imperceptible, meaning what you see on this panel is about as close to the source content as consumer display technology
