# HyperX Omen 16 Valorant Edition

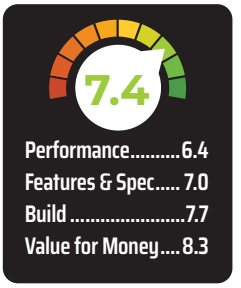

## 240 Hz Glory with a Valorant Tax

₹2,35,000

Somewhere in a HyperX marketing meeting, someone must have pitched "what if the laptop looked like it instalocked Jett" and the room just went with it. And honestly, fair enough. Valorant has one of the most devoted fanbases in competitive gaming, the kind that will happily debate Viper lineups at 2am and can identify a map callout from a single blurry screenshot. Slapping a Spike on a laptop was never going to be a hard sell.

The HyperX Omen 16 Valorant Edition – a laptop which feels like it went in the Valorant Store and bought all its items. Red colored WASD keys, agents' role badges placed close to the vents, a power button which works as the Valorant's logo and even "VLRNT PRTCL" written under the touchpad – this laptop fits perfectly to the collection of collectible editions of weapons.

However, when you take off all the stickers, lore-friendly map references, and red colored lines on the body of the laptop, you suddenly have a very legitimate question – is this Valorant laptop, built specially to make you shoot better or just a gaming laptop with Valorant-themed paint job? It is the second one and after accepting this truth, the rest of this review becomes much more interesting as we can finally discuss whether this laptop can back up the hype.

### DESIGN

One can see the game's logo, a red V printed on the top of the lid under the HyperX logo, a small logo on the bottom right corner, and the names of three maps and the countries, where these are from. These maps include Haven, Split and Bind from Bhutan, Japan and Morocco.

Once the lid is opened, one can see another game logo next to the AMD and NVIDIA logos, several red accent stripes, as well as Spike logo hidden in the bottom left corner. A power button features Valorant logo and the WASD keys have red printings, which is nice for the gamers. Finally, one can find a phrase "VLRNT PRTCL" on the touchpad deck; it is something that I missed initially and was pleasantly surprised when I noticed it during my second day of use. Moreover, four agent role icons – Duelist, Initiator, Controller, and Sentinel – are placed on the right side near the ventilation holes.

It is an enjoyable laptop to have for any Valorant lover, but nothing interferes with the laptop itself. The official colour for the laptop is a dark blue but to my eyes, it appears more on the dark gray side. Regardless, the problem with the color is that it attracts fingerprints everywhere, and you will need to have your cleaning cloth with you always if you are particular about the appearance of your laptop in photos.

### DISPLAY

If there's one component that justifies this laptop's existence for competitive play, it's the screen. You get a 16-inch 2560×1600 IPS screen with a 240Hz refresh rate and a 3ms response time, and when playing the game like Valorant, this is the refresh rate needed. The maximum brightness levels are 500 nits, and throughout the entire gameplay session, I have never once needed to squint or struggle with glare on the screen.

### PERFORMANCE

Under the hood, this configuration pairs an AMD Ryzen 9 9955HX with an Nvidia RTX 5070 carrying 8GB of VRAM, backed by 24GB of DDR5-5600 RAM and a 1TB SSD.

In Valorant itself, the numbers are pretty high for a competitive shooter, and the rest of the library held up just as well. None of the games I tested gave the laptop any trouble, and it was a noticeably more enjoyable experience than gaming on my regular laptop, an Intel Core i5-13420H with an RTX 4050.

For a game like Valorant, frame rates north of 400fps are less about visible smoothness and more about squeezing out every bit of input responsiveness that a 240Hz panel can actually display, which matters when a fraction of a second decides a duel.

Synthetic benchmarks back up what the in-game numbers suggest, and there's a full spread of them worth going
