

through, since each one is stress-testing a different part of the machine.

Graphics

3DMark's TimeSpy and FireStrike tests simulate DirectX 12 and DirectX 11 gaming workloads respectively, without being tied to any actual game engine, at increasingly demanding resolutions as you move from the base test to Extreme and Ultra variants. The scores reflect raw graphical horsepower, and the gap between the base and Extreme/Ultra runs shows how well performance holds up as the workload gets heavier, which matters if you plan on gaming at higher resolutions or with ray tracing turned on. Port Royal specifically isolates ray tracing performance, and a score of 9,115fps here suggests the RTX 5070 handles ray-traced effects reasonably well for its class, though this is still a mid-tier ray tracing GPU.

CPU and System

Cinebench R23 stress-tests the CPU by rendering a complex 3D scene, once using a single core and once using every core available. The single-core score reflects how snappy the chip feels for tasks that don't spread across multiple cores well, like a lot of everyday apps and lighter creative software, while the multi-core score of 36,239 shows the kind of raw, sustained muscle you get for video exports, batch photo processing, or Blender renders that hammer every core at once. Geekbench 6 tests a similar single-core versus multi-core split, but through short bursts of everyday workloads like PDF rendering, image processing, and light machine learning tasks rather than one long render. It's a better proxy for how responsive the system feels during normal use, things like app launches and multitasking, than for sustained heavy lifting.

THERMALS AND BATTERY

It's an outright gaming laptop, and with that comes the customary pros and cons. For starters, it tips the scales at almost 2.5kg, and this is without considering its rather heavy 280W charging brick, both of which get heated up to a great degree under load. Under the battery test, it could manage only about 80 minutes of use, just enough for a brief session while commuting, but this is basically a plug-and-play computer.

Thermal throttling is a major issue. Under a throttle test with Cinebench R23, there was a staggering drop in the score by 1850 points from the initial run. The bright side to this is that despite getting hot internally, the surface remains normal with the highest temperature in my testing reaching 40 degrees in the WASD Cluster but never feeling like it on your fingers.

– Vyom Ramani

SPECIFICATIONS

Processor: AMD Ryzen 9 9955HX | GPU: NVIDIA GeForce RTX 5070 | VRAM: 8 GB GDDR7 | Memory: 24 GB DDR5 - 5600 MT/s | Storage: 1 TB Gen 4 | Display: 16-inch 2560×1600 IPS screen | Refresh Rate: 240 Hz | Brightness: 500 nits | Ports: 3 USB Type-A, 1 HDMI 2.1, 1 audio jack, 1 USB Type-C | Battery: 6-Cell 83 Whr | Power Supply: 280 Watts
