Jabra Evolve2 75

The business headset that means business

₹39,999

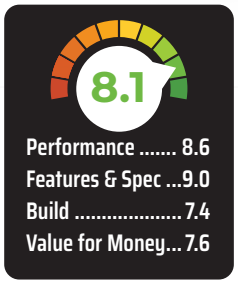

The lines between the home office, the open-plan workspace and the commute have blurred considerably over the past few years, and the headset market has tried to keep up. Most offerings at this tier promise call clarity, noise isolation and enough battery to survive a full working day. The Jabra Evolve2 75 promises a professional-grade wireless headset built around the idea that voice quality on calls is not a secondary feature but the entire point. It has eight microphones, advanced beamforming, a physical boom arm, compatibility with Microsoft Teams, Zoom and Amazon Alexa, and a busy light that signals to nearby colleagues that you are on a call. This headset is designed for people whose work revolves around communication and it has been tuned. Whether it earns its position as a good wireless headsets for professional use is what we want to answer.

DESIGN AND BUILD

The Evolve2 75 is an on-ear headset weighing 197 g which is light enough to wear comfortably across a full working day. The ear cups swivel and tilt to adapt to head shape, the headband uses ultra-soft foam covered in leatherette and the dual-foam cushions distribute contact pressure evenly. In extended use, heat build-up on the ears is minimal, which matters more in the long run. You can wear this for four or five hours of back-to-back calls without the discomfort that some over-ear designs introduce.

The build is predominantly plastic with leatherette finishing. It is functional and sturdy rather than premium-feeling. At this price, a more refined material choice would not have been unreasonable and this is the Evolve2 75's clearest aesthetic limitation. That said, the metal slide arm on the headband adjusts smoothly and feels built to last, and the construction holds up well to daily bag-and-desk routine.

The boom arm is the standout physical design feature. It folds neatly into the right ear cup when not in use and deploys downward for calls.

CALL AND MIC QUALITY

Eight microphones, configured as four analogue and four digital MEMS units, work together using beamforming to isolate your voice and suppress background noise. The boom microphone transmits your voice with a clarity and directness that the integrated microphones in the ear cups do not match. In a busy environment, an open-plan office, a co-working space, or a home with family noise in the background, the difference is audible to whoever is on the other end of your call.

The integrated microphones in the ear cups handle everyday use well enough when the boom is stowed, but for any serious call, deploying the boom arm is the right call. The SideTone function, which feeds your own voice back to you at an adjustable level, creates a more natural conversation experience and is configurable through the Jabra Direct software or the Jabra Sound+ app.

Certifications for Microsoft Teams, Zoom, Amazon Alexa and MFi mean the headset integrates deeply with the platforms most professional users actually rely on.

ANC AND HEARTHROUGH

The active noise cancellation uses four of the eight microphones and handles low-frequency ambient noise well. The hum of an air conditioning unit, traffic noise from outside, the background rumble of a busy environment: these are attenuated meaningfully. Where the ANC is less effective is in the mid and upper frequencies. Voices from nearby colleagues do not disappear and higher-pitched ambient sounds are only partially filtered. For an on-ear headset, this is a physics constraint as much as a tuning one, and the Evolve2 75 performs credibly within that constraint rather than overselling what it can do.

HearThrough mode is the more practical feature in a professional context. It amplifies external sounds so you can hold a face-to-face conversation without removing the headset. The implementation is clear and natural at all amplification levels and switching between ANC, HearThrough and standard mode is a single button press on the left ear cup.
