Asus Pad T3201

The tablet that broke the OLED price barrier

₹43,990

The Android tablet market in India has, for a long time, treated OLED displays as a flagship-tier feature. If you wanted a large-format OLED tablet, you were looking at an iPad Pro at Rs 1,00,000 and above, or a Samsung Galaxy Tab S9 at similar or higher prices. The Asus Pad T3201 changes that because at Rs 43,990 for the 128 GB variant, it brings a 12.2-inch dual-layer OLED display to a segment that has otherwise been dominated by LCD panels. The dual-layer design, which stacks two OLED light-emitting layers to achieve higher brightness, better efficiency and a longer panel lifespan than conventional single-layer panels, is a premium technology. Finding it in a tablet at this price is a meaningful development for the segment.

This is a content consumption device. A large, bright, high-refresh-rate OLED screen, quad speakers with Dolby Atmos, a 9000 mAh battery, a protective case included in the box and storage expandable to 1 TB via microSD. The MediaTek Dimensity 8300 chip handles the performance side while Android 16 runs the software. Despite being Widevine L1 certified, the Asus Pad has not received DRM certification from Netflix, Prime Video or JioHotstar at launch. For a tablet being positioned as a streaming and entertainment device, this is a significant gap and it is the tension at the centre of every other good thing this tablet does.

DESIGN

At 6.5 mm thick and 523 g, the Asus Pad is one of the lighter 12.2-inch tablets available on the market. It slides into a bag without demanding attention and holds comfortably in one hand for extended reading or web browsing sessions. The fibreglass back is smooth, with a matte finish that resists fingerprints reasonably well.

The front is dominated by the display, which takes up 92% of the face and the bezels are slim and uniform. The USB-C port (USB 3.0 with DisplayPort 1.4 support) is the only physical port: there is no 3.5mm headphone socket, which means you need to get a pair of Bluetooth headphones or a USB-C adapter for wired audio. The protective case in the box supports four stand modes covering viewing, typing and propped-up orientations, which makes the package feel more complete at this price. The Asus Pen 2.0 stylus is supported but like with most tablets, it is sold separately. The tablet is available only in Pure White colour at launch.

DISPLAY

The 12.2-inch dual-layer OLED panel is the most compelling reason to consider the Asus Pad and our Calman display measurements largely bear out what Asus claims.

The display covers 99.99% of DCI-P3 in both CIE 1931 xy and CIE 1976 uv colour spaces, confirming the 100% DCI-P3 claim. The sRGB gamut coverage measures 153.27%, which means the panel's native colour volume extends well beyond the sRGB standard. In practice, this produces vivid, punchy colours for consumer content; in precise terms, sRGB content will appear more saturated than intended unless the device's colour management mode compensates.

In the D65 P3 profile, the Calman ColourChecker test returned an average DeltaE 2000 of 2.71 against a maximum of 4.81. An average under three is the generally accepted threshold for a well-calibrated consumer display, and the Asus Pad sits within that range. The DeltaE ITP average of 11.69 (maximum 35.18) reflects some colour drift in the most saturated regions of the gamut, which is typical of wide-gamut displays tuned for visual vibrancy rather than clinical accuracy. For your everyday content consumption, this is not a problem, but worth knowing for colour-critical creative work.

Our peak brightness test measured 2,710 nits in HDR mode and 805 nits in SDR, both exceeding Asus's stated 2,000 nit peak and 600 nit typical figures respectively. Outdoor visibility under direct sunlight is handled comfortably at these levels. The dual-layer panel's efficiency advantage over conventional OLED also means the display sustains brightness without the
