Acerpure Nitro 55-inch QLED TV

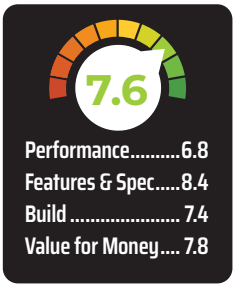

Feature rich, but picture quality needs some tuning

₹41,499

The 55-inch TV segment has become increasingly competitive, with brands offering QLED panels, high refresh rates and gaming features at prices that were once reserved for more basic 4K TVs. The Acerpure Nitro is one such offering, priced at around Rs 39,000 and bringing a 4K QLED display, 120Hz support, Dolby Vision, VRR, ALLM and a 50W speaker system to the table. You also get Google TV, MEMC, a dedicated gaming menu and a surprisingly extensive set of picture controls.

There is plenty to like about the feature list, especially the price. Acerpure has also added a few unusual touches, including a Karaoke button on the Bluetooth remote. With so much packed into a 55-inch TV, the Nitro makes a strong case on paper. Let's see how it all comes together in reality. Here's my review of the Acerpure Nitro 55-inch QLED TV.

DESIGN AND BUILD

The Acerpure Nitro feels sturdy and well-built, despite using plastic for parts of its construction. It doesn't feel flimsy when handled, and the overall build gives it a reassuring amount of heft. Up front, slim bezels on three sides keep the design fairly clean, while a slightly thicker chin at the bottom carries Acerpure branding. The chin is noticeable, but isn't large enough to become distracting.

For tabletop placement, Acerpure includes plastic stands that do the job reasonably well. However, there is still a fair amount of movement when the TV is shaken, although this is mainly noticeable while cleaning the display or handling the TV rather than during regular viewing. Both the stands and the chin have a piano-black finish.

Acerpure also includes a wall mount in the box, giving you the option of mounting the TV without having to purchase a separate one.

PORTS AND CONNECTIVITY

Connectivity is arranged in an L-shaped formation, with the HDMI ports positioned along the side and the remaining connections facing downwards. This makes the HDMI ports easier to access when connecting external devices, while the downward-facing connections work well for wall mounting.

The side section has three HDMI ports and a USB 3.0 port, while the downward section includes USB 2.0, Ethernet, optical audio output, AV input and antenna/satellite connections. The HDMI 1 port supports ARC/eARC.

DISPLAY AND QUALITY

The Acerpure Nitro uses a 55-inch 4K QLED panel. It supports a 120Hz refresh rate, along with HDR and Dolby Vision, giving it a solid display spec in this price range. The panel also supports features such as MEMC, VRR and ALLM, which make it suitable for everything from movies and sports to gaming.

With 4K content, the display produces a reasonably sharp image, although the picture quality isn't equally convincing across all types of content. HDR content gets a noticeable boost in brightness, but colour reproduction and black levels are where I found some shortcomings.

In the Calman luminance test, HDR brightness measured around 330 nits, depending on the test window. The panel covered around 93.25% in DCI-P3, while BT.2020 coverage stood at around 77%. The numbers are fairly reasonable for a TV in this price range, but the actual viewing experience shows some limitations in colour reproduction.

I noticed this particularly with highly saturated colours. While watching Tron: Ares, red looked somewhat dull and leaned towards orange rather than appearing properly vibrant. In one of the server scenes, a vibrant blue also appeared to have a slight purple tint. The same behaviour was
