

removes a ceiling instead of creating one. Netflix will automatically drop you to 1080p silently if any single link fails, and the browser link is the most important one here.

Netflix updated its requirements in August 2026 to finally list Chrome 117 and later as 4K-capable – but only on Windows 11. On macOS, Chrome still tops out at 1080p and you need Safari. On Linux, Chrome is capped at 720p. You also need a Premium plan, a supported GPU, a 4K 60Hz display with HDCP 2.2 on external connections, and roughly 15 Mbps.

How to do it:

1. Go to netflix.com → Account → Profiles → your profile → Playback settings.
2. Set Data usage per screen to High.
3. Now check your browser: Windows 11 users can stay on Chrome, Mac users need Safari, and Linux users should watch on a TV or streaming stick instead.
4. Verify with the Ctrl+Shift+Alt+D overlay from tip one.

An interesting thing to note here is that even on Chrome for Windows 11, HDR and Dolby Atmos still aren't supported. Edge or the native Windows app remain ahead there.

4) Tell Netflix which languages you actually speak

This is the most underused setting on the platform, and for Indian viewers it can be very useful. Buried in profile settings is a multi-select list called Audio & Subtitle Languages. It isn't the same as your display language.

It's effectively you telling Netflix "these are the languages I watch in" – and Netflix uses it to decide what surfaces on your homepage.

Tick Hindi, Tamil, Telugu, Malayalam, Marathi, Bengali or Korean, and rows of content you had never seen before start appearing.

How to do it:

1. In the mobile app, tap My Netflix → Manage Profiles → your profile.
2. Tap Audio & Subtitle Languages (this is separate from Display Language).
3. Select every language you're happy to watch in. It's a multi-select, so don't stop at one.
4. On the web, the same options sit under Account → Profiles → your profile → Languages.

One quirk, though, is that audio and subtitle preferences don't persist when you watch Kids titles from an adult profile

5) Hide from viewing history

Everybody knows you can clear a title off Continue Watching. Almost nobody realises that doing it from your phone or TV only removes it from that row. The title stays in your viewing history and keeps shaping how netflix sends you recommendations.

To actually stop something influencing your homepage, you have to hide it from viewing activity – and that is web-only.

How to do it:

1. Sign in at netflix.com in a browser. This will not work in the laptop or mobile app or on a TV.
2. Go to Account → Profiles → your profile → Viewing activity.
3. Click the circular hide icon next to any title. If you hide an episode, Netflix offers to hide the whole series.
