

quadrilateral

A plane shape with four sides and four angles.

Example

Some special quadrilaterals are:

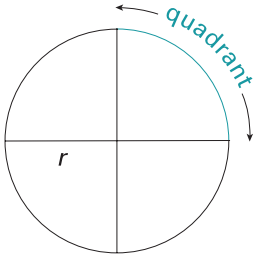

See kite, parallelogram, planar figure, rectangle, rhombus, square, trapezium

quadrant

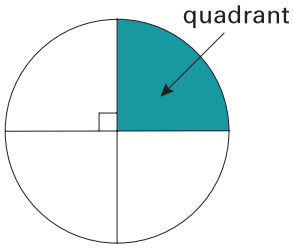

(i) A quarter of the circumference of a circle.

Example

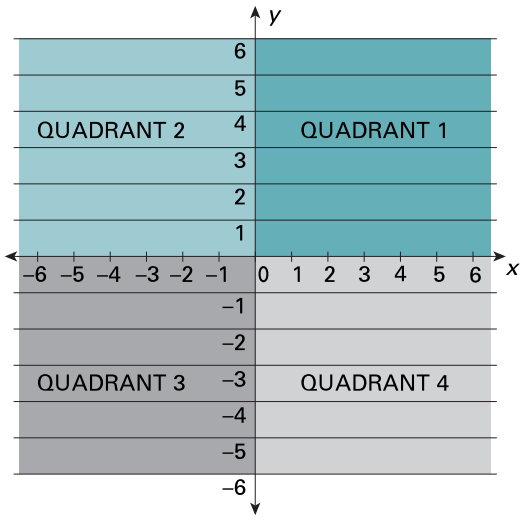

(ii) A plane figure made by two radii of a circle at a 90° angle and the arc cut off by them.

Example

(iii) In coordinate geometry we use the space between the *x*-axis and *y*-axis. We can extend the *x*-axis and the *y*-axis so that all four quadrants of the number plane can be seen. Quadrants are numbered in an anticlockwise direction.

Example

See arc, coordinates, ordered pair, radius
