angle of depression
(of an object)

An angle formed between the horizontal line and the line of sight to an object below.

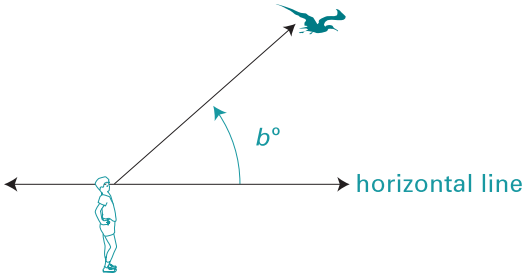

The angle of depression is $a°$.

See angle of elevation

angle of elevation

An angle formed between the horizontal line and the line of sight to an object above.

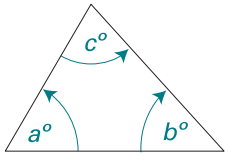

The angle of elevation is $b°$.

See angle of depression

angle sum

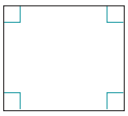

The total amount of degrees in any polygon.

(i) Angle sum of a triangle is 180°.

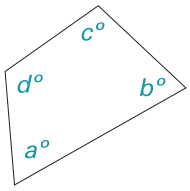

$a° + b° + c° = 180°$

(ii) Angle sum of a quadrilateral is 360°.

$4 \times 90° = 360°$

$a° + b° + c° + d° = 360°$

(iii) Angle sum of any polygon may be found:
number of vertices × 180° – 360° or
(number of vertices – 2) × 180°

Examples

triangle	(3 × 180°) – 360° = 180° or (3 – 2) × 180° = 180°
pentagon	(5 – 2) × 180° = 540°
hexagon	(6 × 180°) – 360° = 720°

annual

(i) Happening only once a year.

Example

Annual flower show.

(ii) Recurring yearly.

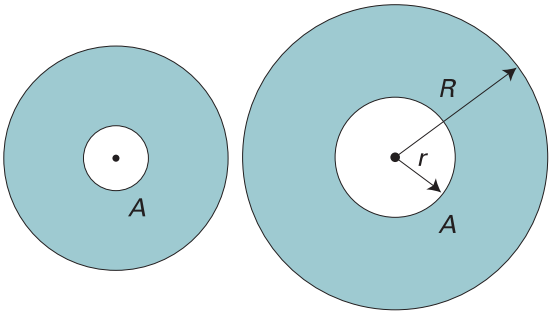

Example

Annual rate of interest is 6.5%.

See per annum, per cent

annulus

The area between two concentric circles.

$A = \pi (R^2 - r^2)$

See area, circle, concentric circles
