(ii) Difference (comparison).

Example

Remy has seven pencils and Robin has three pencils. How many more pencils has Remy than Robin?

$7 - 3 = \square$

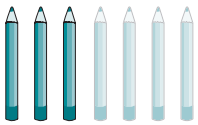

$7 - 3 = 4$

Remy has 4 more pencils than Robin.

(iii) Complementary addition (missing addend, counting on).

Example

Rowan has three pencils, but needs seven. How many more must he get?

$3 + \square = 7$

$3 + 4 = 7$

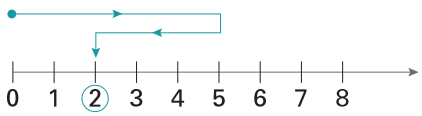

Rowan must get 4 more pencils.

Subtraction may be represented on a number line.

Example

Show on the number line:

$5 - 3 = 2$

See complementary addition, difference, number line

subtrahend

A number which is to be subtracted from another number.

Example

$$\underset{\text{minuend}}{12} - \underset{\text{subtrahend}}{4} = \underset{\text{difference}}{8}$$

Four is the subtrahend.

See difference, minuend, subtract

sum

The answer to an addition problem. It is the total amount resulting from the addition of two or more numbers (called addends), quantities or magnitudes.

Example

$$\underset{\text{addends}}{3 + 4} = \underset{\text{sum}}{7}$$

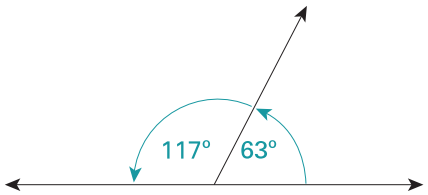

Seven is the sum.

See addend, addition

supplementary angles

Two angles which together make 180°.

Example

Angles 117° and 63° are supplementary.

Angle 117° is called the supplement of 63°.

Angle 63° is called the supplement of 117°.

See complementary angles, parallel lines
