tree diagram

A diagram that has a branch tree-like structure and shows all possible outcomes.

Example

A family with three children. The first child could have been a girl or a boy, so could have the second and third child.

A tree diagram shows all possible outcomes as follows:

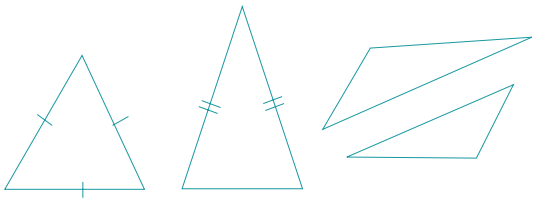

triangle

A polygon with three sides and three angles. We can classify triangles by sides or by angles.

(i) By sides.

Examples

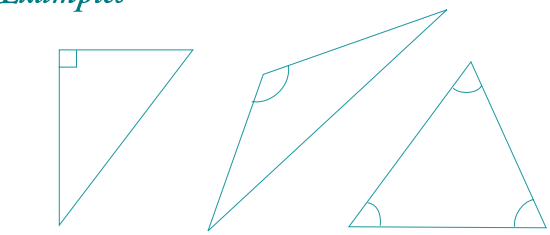

equilateral
3 sides equal

isosceles
2 sides equal

scalene
all sides different in length

(ii) By angles.

Examples

right-angled
1 angle = 90°

obtuse
1 angle > 90°

acute
all angles < 90°

The sum of angles inside a triangle is always 180°.

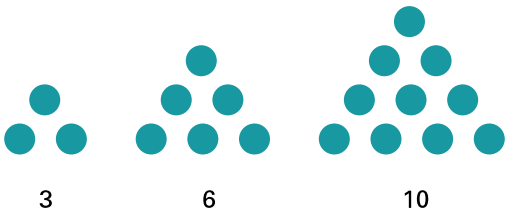

See equilateral triangle, isosceles triangle, plane shape, right-angled triangle, scalene triangle, sum

triangle number

(triangular number)

A number that can be represented by dots in the shape of a triangle.

Examples

See triangle

trillion

A trillion is a million millions, that is, 1 000 000 000 000, or 10^{12}.

See section Large numbers on page 152

true sentence

A sentence about numbers that is true or correct.

Examples

$3 \times 2 = 2 \times 3$ is a true sentence.

$6 \neq 5$ is a true sentence.

The open number sentence $2 + \square = 9$ becomes true, if $\square$ is replaced by 7.

If $\square$ is replaced by any other number, then it will become a false sentence.

See false sentence, number sentence, open number sentence
