bisector

A straight line which divides an angle, or an interval, into two equal parts.

Examples

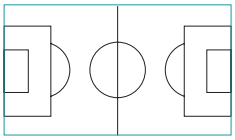

See bisect, interval, midpoint

boundary

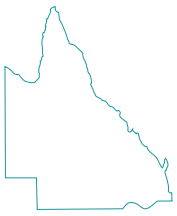

A line around the edge of a region.

Examples

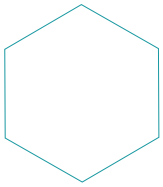

(i) The boundary around a soccer field

(ii) The boundary of Queensland

(iii) The boundary of a hexagon is its perimeter.

See perimeter, region

braces

(i) Braces are used for grouping numbers together.

Example

$\{\ \}$ $\{3 + [12 - 3\ (2 + 1)] \times 2\}$

braces $= \{3 + [12 - 9] \times 2\}$

$= 3 + 6$

$= 9$

(ii) The sign { } is used to stand for the word 'set'. The elements of the set are written inside these 'curly brackets'.

Example

The set of counting numbers

{1, 2, 3, 4, 5, 6, 7...}

See brackets, order of operations, parentheses

brackets

The signs ( ) [ ] { } are used for grouping things or numbers together.

( )	[ ]	{ }
ordinary brackets (parentheses)	square brackets	braces

Brackets are used to indicate the order of operations.

Example

$5\ \{2[4(3 + 10) - (35 \div 5) - 8]\}$

$= 5\ \{2[(4 \times 13) - 7 - 8]\}$ **1 remove ordinary brackets**

$= 5\ \{2[52 - 15]\}$ **2 remove square brackets**

$= 5\ \{2 \times 37\}$ **3 remove braces**

$= 5 \times 74 = 370$

See braces, order of operations, parentheses
