Copy and paste the following file content. Change the IP address from 172.31.x.x to the IP address from the `ifconfig` output for the networking interface `eth0`:

```
<VirtualHost 172.31.x.x:80>
  DocumentRoot /var/www/html/a
</VirtualHost>
```

Press CTRL + X and select y to save the file.

Repeat the same process for a configuration file named b.conf under /etc/httpd/ conf.d with the following content. Change the IP address from 172.31.y.y to the IP address from the `ifconfig` output for the networking interface `eth1`:

```
<VirtualHost 172.31.y.y:80>
  DocumentRoot /var/www/html/b
</VirtualHost>
```

To activate the new web server configuration, execute `systemctl restart httpd`.

Next, go to the Elastic IP overview in the Management Console. Copy both public IP addresses, and open them with your web browser. You should get the answer “Hello A!” or “Hello B!,” depending on the public IP address you’re calling. Thus, you can deliver two different websites, depending on which public IP address the user is calling. Congrats—you’re finished!

NOTE You switched to the AWS region in Sydney earlier. Now you need to switch back to the region US East (N. Virginia). You can do so by selecting US East (N. Virginia) from the region chooser in the main navigation menu of the Management Console.
