- Processing parts of the requests for a web application, when the system is designed for fault tolerance

On top of that, we use Spot Instances for test systems where dealing with short outages is worth the cost savings.

As discussed in the previous section, using Savings Plans does not require any changes to your EC2 instances. But to use Spot Instances, you have to launch new EC2 instances and also plan for interrupted virtual machines.

Next, you will launch your first spot instance as follows:

1. Go to EC2 in the AWS Management Console: https://console.aws.amazon.com/ ec2/.
2. Select Spot Requests from the subnavigation options.
3. Click the Request Spot Instances button.
