```
  ],
  "detail-type": [
    "AWS API Call via CloudTrail"    ②
  ],
  "detail": {
    "eventSource": [
      "ec2.amazonaws.com"            ③
    ],
    "eventName": [
      "RunInstances"                 ④
    ]
  }
}
```

① Filters events from the EC2 service

② Filters events from CloudTrail caused by AWS API calls

③ Filters events from the EC2 service

④ Filters events with event name RunInstances, which is the AWS API call to launch an EC2 instance

Defining filters on other event attributes is possible as well, in case you are planning to write another rule in the future. The rule format stays the same.

When specifying an event pattern, we typically use the following fields, which are included in every event:

- `source`—The namespace of the service that generated the event. See “Amazon Resource Names (ARNs)” at http://mng.bz/o5WD for details.
- `detail-type`—Categorizes the event in more detail.

See “EventBridge Event Patterns” at http://mng.bz/nejd for more detailed information.

You have now defined the events that will trigger your Lambda function. Next, you will implement the Lambda function.
