```
$ aws cloudformation delete-stack --stack-name ebs
```

8.2 Instance store: Temporary block-level storage

An *instance store* provides block-level storage directly attached to the physical machine hosting the virtual machine. Figure 8.2 shows that the instance store is part of an EC2 instance and available only if your instance is running; it won’t persist your data if you stop or terminate the instance. You don’t pay separately for an instance store; instance store charges are included in the EC2 instance price.
