- *Filesystem*—Stores your data
- *Mount target*—Makes your data accessible

The filesystem is the resource that stores your data in an AWS region, but you can't access it directly. To do so, you must create an EFS mount target in a subnet. The mount target provides a network endpoint that you can use to mount the filesystem on an EC2 instance via NFSv4.1. The EC2 instance must be in the same subnet as the EFS mount target, but you can create mount targets in multiple subnets. Figure 9.2 demonstrates how to access the filesystem from EC2 instances running in multiple subnets.

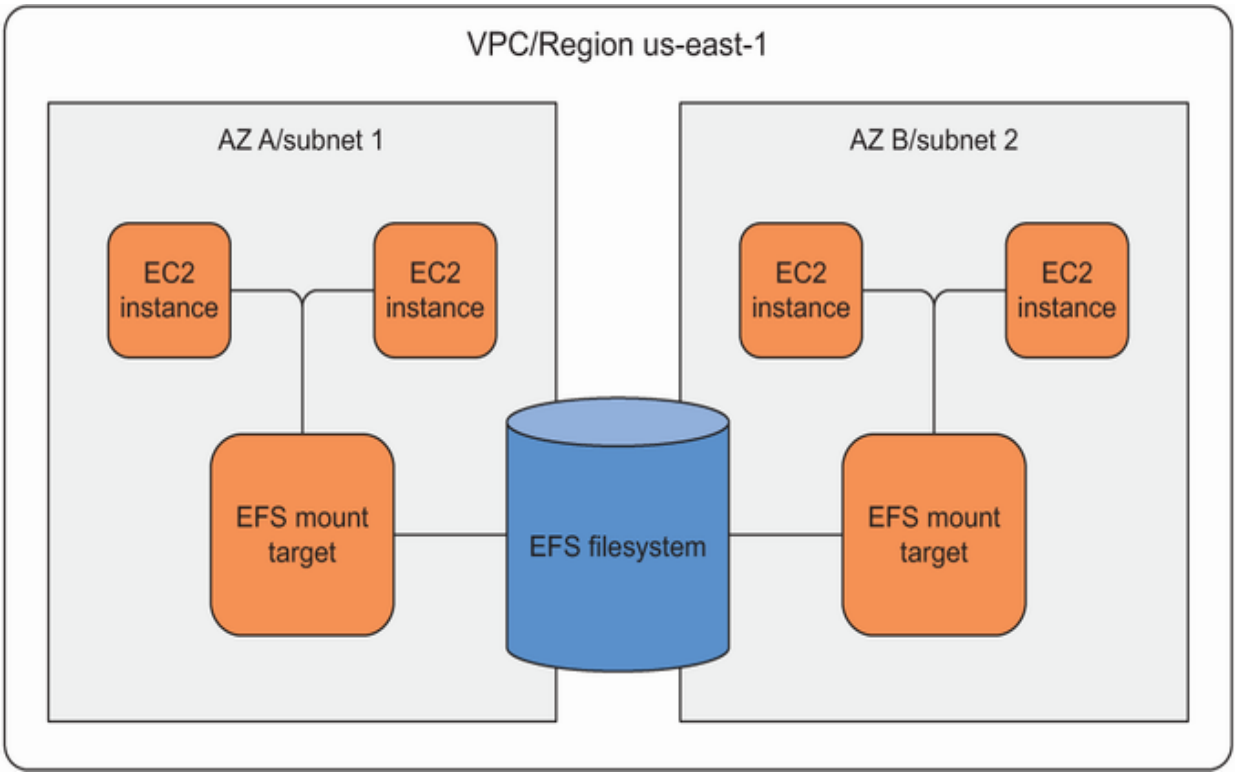

Figure 9.2 Mount targets provide an endpoint for EC2 instances to mount the filesystem in a subnet.
