```
    "NotificationARNs": [],
    "StackStatus": "CREATE_COMPLETE",                                    ②
    "DisableRollback": false
  }]
}
```

① Opens this URL in your browser to open the WordPress application

② Waits for state CREATE_COMPLETE for the CloudFormation stack

Launching and operating a relational database like MySQL is that simple. Of course, you can also use the Management Console (https://console.aws.amazon.com/rds/) to launch an RDS database instance instead of using a CloudFormation template. RDS is a managed service, and AWS handles most of the tasks necessary to operate your database in a secure and reliable way. You need to do only two things:

- Monitor your database's available storage, and make sure you increase the allocated storage as needed.
- Monitor your database's performance, and make sure you increase I/O and computing performance as needed.

Both tasks can be handled with the help of CloudWatch monitoring, as you'll learn later in the chapter.

10.1.2 Exploring an RDS database instance with a MySQL engine

The CloudFormation stack created an RDS database instance with the MySQL engine. Each database instance offers an endpoint for clients. Clients send their SQL queries to this endpoint to query, insert, delete, or update data. For example, to retrieve all rows from a table, an application sends the following SQL request: `SELECT * FROM`
