```
const fs = require('fs');                    ①
const docopt = require('docopt');            ②
const moment = require('moment');            ③
const AWS = require('aws-sdk');              ④
const db = new AWS.DynamoDB({
  region: 'us-east-1'
});

const cli = fs.readFileSync('./cli.txt',
➥ {encoding: 'utf8'});                      ⑤
const input = docopt.docopt(cli, {           ⑥
  version: '1.0',
  argv: process.argv.splice(2)
});
```

① Loads the fs module to access the filesystem

② Loads the docopt module to read input arguments

③ Loads the moment module to simplify temporal types in JavaScript

④ Loads the AWS SDK module

⑤ Reads the CLI description from the file cli.txt

⑥ Parses the arguments, and saves them to an input variable

Next, you will add an item to a table. The next listing explains the `putItem` method of the AWS SDK for Node.js.

Listing 12.4 DynamoDB: Creating an item

```
const params = {
  Item: {                                    ①
    attr1: {S: 'val1'},                      ②
    attr2: {N: '2'}                          ③
  },
  TableName: 'app-entity'                    ④
};
db.putItem(params, (err) => {                ⑤
  if (err) {                                 ⑥
    console.error('error', err);
  } else {
    console.log('success');
  }
});
```
