## Local secondary index

Besides global secondary indexes, DynamoDB also supports local secondary indexes. A local secondary index must use the same partition key as the table. You can only vary on the attribute that is used as the sort key. A local secondary index consumes the read and write capacity of the table.

A huge benefit of DynamoDB is that you can provision capacity based on your workload. If one of your global secondary indexes gets tons of read traffic, you can increase the read capacity of that index. You can fine-tune your database performance by provisioning sufficient capacity for your tables and indexes. You'll learn more about that in section 13.9.

### *12.4.4 Creating and querying a global secondary index*

Back to nodetodo. John needs the shopping list including Emma's and his tasks for his trip to town.

To implement the retrieval of tasks by category, you'll add a secondary index to the `todo-task` table. This will allow you to make queries by category. A partition key and sort key are used: the partition key is the `category` attribute, and the sort key is the `tid` attribute. The index also needs a name: `category-index`. You can find the following CLI command in the README.md file in nodetodo's code folder and simply copy and paste:
