```
$ aws dynamodb execute-statement --statement \
➥ "SELECT * FROM \""todo-task\".\"category-index\""
➥ WHERE category = 'shopping'"
```

Please note that combining multiple queries (`JOIN`) is not supported by DynamoDB. However, DynamoDB supports modifying data with the help of PartiQL. The following command updates Emma's phone number:

```
aws dynamodb execute-statement --statement \
➥ "Update \"todo-user\" SET phone='+33333333' WHERE uid='emma'"
```

Be warned, an `UPDATE` or `DELETE` statement must include a `WHERE` clause that identifies a single item by its partition key or partition and sort keys. Therefore, it is not possible to update or delete more than one item per query.

Want to learn more about PartiQL for DynamoDB? Check out the official documentation: http://mng.bz/N5g2.

In our opinion, using PartiQL is confusing because it pretends to provide a flexible SQL language but is in fact very limited. We prefer using the DynamoDB APIs and the SDK, which is much more descriptive.

12.9 DynamoDB Local

Imagine a team of developers is working on a new app using DynamoDB. During development, each developer needs an isolated database so as not to corrupt the other team members' data. They also want to write unit tests to make sure their app is working. To address their needs, you could create a unique set of DynamoDB
