To get some detail about the load balancer in the graphical user interface, navigate to the EC2 Management Console. The subnavigation menu on the left has a Load Balancing section where you can find a link to your load balancers. Select the one and only load balancer. You will see details at the bottom of the page. The details contain a Monitoring tab, where you can find charts about latency, number of requests, and much more. Keep in mind that those charts are one minute behind, so you may have to wait until you see the requests you made to the load balancer.

Cleaning up

Delete the CloudFormation stack you created.

14.2 Asynchronous decoupling with message queues

Synchronous decoupling with ELB is easy; you don’t need to change your code to do it. But for asynchronous decoupling, you have to adapt your code to work with a message queue.

A message queue has a head and a tail. You can add new messages to the tail while reading messages from the head. This allows you to decouple the production and consumption of messages. Now, why would you want to decouple the producers/requesters from consumers/receivers? You can achieve the following key benefits:
