```
const sqs = new AWS.SQS({});                                    ①

if (process.argv.length !== 3) {                                ②
  console.log('URL missing');
  process.exit(1);
}

const id = uuidv4();                                            ③
const body = {                                                  ④
  id: id,
  url: process.argv[2]
};

sqs.sendMessage({                                               ⑤
  MessageBody: JSON.stringify(body),                            ⑥
  QueueUrl: config.QueueUrl                                     ⑦
}, (err) => {
  if (err) {
    console.log('error', err);
  } else {
    console.log('PNG will be soon available at http://' + config.Bucket
    ➥ + '.s3.amazonaws.com/' + id + '.png');
  }
});
```

① Creates an SQS client

② Checks whether a URL was provided

③ Creates a random ID

④ The payload contains the random ID and the URL.

⑤ Invokes the sendMessage operation on SQS

⑥ Converts the payload into a JSON string

⑦ Queue to which the message is sent (was returned when creating the queue)

Before you can run the script, you need to install the Node.js modules. Run `npm install` in your terminal to install the dependencies. You'll find a config.json file that needs to be modified. Make sure to change `QueueUrl` to the queue you created at the beginning of this example, and change `Bucket` to `url2png-$yourname`.
