Now you can run the script with `node index.js "http://aws.amazon.com"`. The program should respond with something like `PNG will be available soon at http://url2png-$yourname.s3.amazonaws.com/XYZ.png`. To verify that the message is ready for consumption, you can ask the queue how many messages are inside as follows. Replace `$QueueUrl` with your queue's URL:

```
$ aws sqs get-queue-attributes \
➥ --queue-url "$QueueUrl" \
➥ --attribute-names ApproximateNumberOfMessages
{
  "Attributes": {
    "ApproximateNumberOfMessages": "1"
  }
}
```

SQS returns only an approximation of the number of messages. This is due to the distributed nature of SQS. If you don't see your message in the approximation, run the command again and eventually you will see your message. Next, it's time to create the worker that consumes the message and does all the work of generating a PNG.

14.2.5 Consuming messages programmatically

Processing a message with SQS takes the next three steps:

1. Receive a message.
2. Process the message.
3. Acknowledge that the message was successfully processed.
