```
$ aws deploy create-deployment --application-name etherpad-codedeploy \
➥ --deployment-group-name etherpad-codedeploy \
➥ --revision "revisionType=S3,
➥ s3Location={bucket=$BucketName,
➥ key=etherpad-lite-1.8.18.zip,bundleType=zip}"
```

Again, use the AWS Management Console or the following command to check progress, as shown next. Replace `$DeploymentId` with the deployment ID printed to the console from the previous command:

```
$ aws deploy get-deployment --deployment-id $DeploymentId
```

After the deployment is successful, reload the Etherpad web application. Check the version, which should be `4b96ff6` after the update. Congratulations—you have successfully deployed Etherpad with the help of CodeDeploy.

Cleaning up

Don't forget to clean up your AWS account before proceeding with the next step using the following code. Replace `$BucketName` with the name of the bucket used to store deployment artifacts:

```
$ aws s3 rm --recursive s3://${BucketName}
$ aws cloudformation delete-stack --stack-name etherpad-codedeploy
```

By the way, CodeDeploy will also make sure that the latest revision is deployed to any EC2 instances launched by the Auto Scaling group, such as if the health check failed and the Auto Scaling group replaced the failed EC2 instance.
