Summary

- AWS CodeDeploy is designed to automate deployments on EC2, Fargate, and Lambda. Even on-premises machines are supported.
- AWS CloudFormation is actually an Infrastructure as Code tool but comes with features to orchestrate rolling updates of EC2 instances as well.
- By configuring user data for an EC2 instance, you are able to inject a script that the machine will execute at the end of the boot process.
- Packer by HashiCorp is a tool to automate the process of creating Amazon Machine Images (AMIs).
- An immutable server is a server that you do not change after launch. Instead, to deploy changes you replace the old machine with a new one. This approach lowers the risk of side effects caused by former changes or third-party outages.
