

Figure 16.8 Producers send messages to a message queue while consumers read messages.

When designing an asynchronous process, it's important to keep track of the process. You need some kind of identifier for it. When a user wants to upload an image, the user creates a process first. This returns a unique ID. With that ID, the user can upload an image. If the image upload is finished, the worker begins to process the image in the background. The user can look up the process at any time with the process ID. While the image is being processed, the user can't see the sepia image, but as soon as the image is processed, the lookup process returns the sepia image. Figure 16.9 shows the asynchronous process.
