```
    'Item': {
      'id': {
        'S': id                                                    ④
      },
      'version': {
        'N': '0'                                                   ⑤
      },
      'created': {
        'N': Date.now().toString()                                 ⑥
      },
      'state': {
        'S': 'created'                                             ⑦
      }
    },
    'TableName': 'imagery-image',                                  ⑧
    'ConditionExpression': 'attribute_not_exists(id)'              ⑨
  }, function(err, data) {
    if (err) {
      throw err;
    } else {
      response.json({'id': id, 'state': 'created'});               ⑩
    }
  });
});
```

① Registers the route with Express

② Creates a unique ID for the process

③ Invokes the putItem operation on DynamoDB

④ The id attribute will be the primary key in DynamoDB.

⑤ Uses the version for optimistic locking (explained in the following sidebar)

⑥ Stores the date and time when the process was created

⑦ The process is now in the created state: this attribute will change when state transitions happen.

⑧ The DynamoDB table will be created later in the chapter.

⑨ Prevents the item from being replaced if it already exists

⑩ Responds with the process ID

A new process can now be created.
