It will take about five minutes until a simple web server is up and running. Use the following code to get the status and URL of your service, and open the URL in your browser. On a side note, App Runner even supports custom domains, in case that's a crucial feature to you.

Listing 18.2 Fetching information about App Runner services

```
$ aws apprunner list-services
{
  "ServiceSummaryList": [
    {
      "ServiceName": "simple",
      "ServiceId": "5e7ffd09c13d4d6189e99bb51fc0f230",
      "ServiceArn": "arn:aws:apprunner:us-east-1:...",   ①
      "ServiceUrl":
➥ "bxjsdpnnaz.us-east-1.awsapprunner.com",              ②
      "CreatedAt": "2022-01-07T20:26:48+01:00",
      "UpdatedAt": "2022-01-07T20:26:48+01:00",
      "Status": "RUNNING"                                ③
    }
  ]
}
```

① The ARN of the service, needed to delete the service later

② Opens this URL in your browser

③ Waits until the status reaches RUNNING

App Runner is a Platform as a Service (PaaS) offering for container workloads. You provide a container image bundling a web application, and App Runner takes care of everything else, as illustrated in figure 18.2:

- Runs and monitors containers
- Distributes requests among running containers
- Scales the number of containers based on load
