

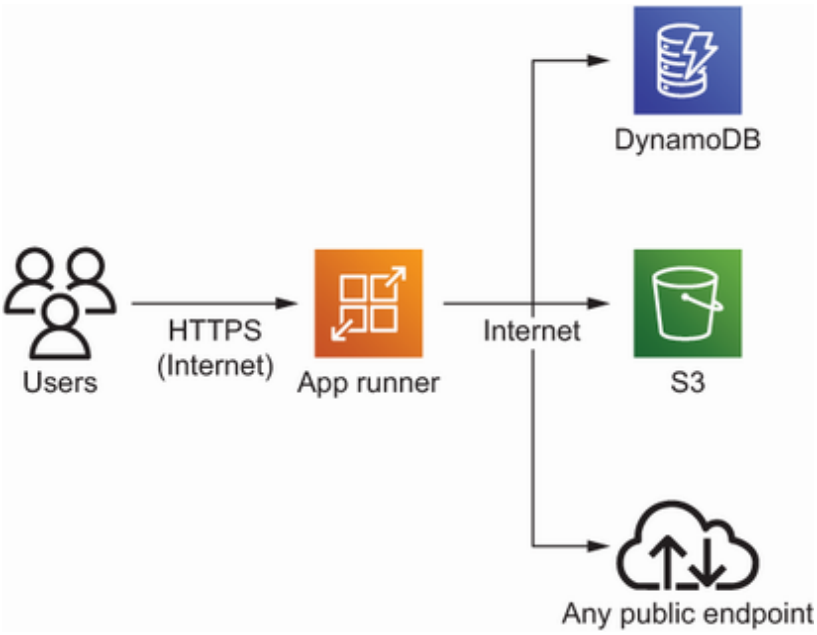

Figure 18.2 App Runner provides a simple way to host containerized web applications.

You pay for memory but not CPU resources during times when a running container does not process any requests. Let's look at pricing with an example. Imagine a web application with minimal resource requirements only used from 9 a.m. to 5 p.m., which is eight hours per day. The minimal configuration on App Runner is 1 vCPU and 2 GB memory:

- Active hours (= hours in which requests are processed)
  - 1 vCPU: $0.064 * 8 * 30 = $15.36 per month
  - 2 GB memory: 2 * $0.007 * 8 * 30 = $3.36 per month
- Inactive hours (= hours in which no requests are processed)
  - 2 GB memory: 2 * $0.007 * 16 * 30 = $6.72 per month

In total, that's $25.44 per month for the smallest configuration supported by App Runner. See "AWS App Runner Pricing" at
